Coding Challenge: ***"Smart Expense Analyzer"***

Objective

Use **Python operators** (arithmetic, comparison, logical, and assignment) to analyze a user's monthly expenses and determine financial status.

Problem Statement

You are given the following data:

salary = 50000
rent = 12000
food = 8000
transport = 3000
entertainment = 4000

Tasks

- **Task 1: Total Expenses**
  - Use **arithmetic operators** to calculate total expenses.
- **Task 2: Savings Calculation**
  - Calculate savings using:

savings = salary - total_expenses

- **Task 3: Expense Comparison**
  - Check:
    - Is rent greater than food expense?
    - Is transport less than entertainment?

Use **comparison operators**.

- **Task 4: Financial Condition Check**
  - If savings:

- Greater than 10,000 → "Good Saving"
- Between 5,000 and 10,000 → "Average Saving"
- Less than 5,000 → "Low Saving"

Use **logical operators (and, or)**.

🔹 **Task 5: Bonus Update**

- Increase salary by 10% using **assignment operators**:

salary += salary * 0.10
